## Project and Certification

**Project Title:** **SOLAR TRACKER ARDUINO PROJECT**

### Overview:

This device keeps a flat panel holding a solar cell continuously following the sun as it moves across the sky. The Arduino uses 2 light dependent resistors (LDRs) that are separated by a fin to compare the light levels on either side and then rotate the servo attached to the panel towards the more illuminated LDR until the two detectors are equal. This is a nice Arduino project which combines sensors with servos, with logic that can be tuned, and has a practical application relating to clean energy.

### Industrail training on 33/11 kV substation

substation is the key part of electrical generation, transmission, and distribution systems. Substation transforms voltage from high to low or from low to high as necessary. Substation also dispatches electric power from generating stations to the consumption center

I was certified and completed industrial training in electrical substation for period of 6 months.
